

COMMAND AI HUB

SIMPLEX-ITY · AI FAMILY COMPANY — COMPLETE BLUEPRINT INCL.
GATEKEEPER PANEL

Version 1.2.1 FINAL · 31
May 2026

Co-authored: Kieran Li + Simpee + Edge (Copilot)

New: Gatekeeper Panel —
full validation transparency

VISION — The AI Family Company: Every AI has a name, a role, a voice, and a responsibility. They know who they are, who they pass to, and who checks their work. New members join with proper onboarding. Every deploy is transparent — you see exactly what was checked, what passed, and what was flagged. **No blind spots. No solo decisions. Built together.**

WHAT'S NEW — Gatekeeper Panel (Edge's Recommendation)

Edge identified a key UX gap: a single green dot tells you nothing passed or failed — only THAT it passed. The Gatekeeper Panel shows the full validation breakdown so Kieran and Simpee can see exactly WHY something passed or failed before deploy.

Addition	What It Does	Where in UI
Gatekeeper Panel	Replaces the simple green/red dot with a full breakdown card showing	Right panel - VALIDATOR - replaces simple green/red dot
4 Check Categories	Syntax Check · Logic Review · Security Audit · Azure Readiness — each in Gatekeeper Panel line with pass/fail/warning status	Inside Gatekeeper Panel
Flag Detail	If any check fails, the exact issue is shown with line reference and suggestion to fix	Expanded Gatekeeper Panel — expandable and why.
Validation History	Last 3 VALIDATOR reviews shown as a log — timestamp, what was checked, overall result	Bottom of Gatekeeper Panel - collapsible
TestLog update	Each VALIDATOR run now writes 4 records to TestLog — one per check category	TestLog entry - with validation Copilot and VALIDATOR Result

GATEKEEPER PANEL — Full UI Specification

This is the exact spec for the builder to implement. Replaces the simple dual-badge row in the right panel.

Panel Header

Element	Detail
Title	VALIDATOR — Gatekeeper Panel (Exo 2, 11px bold, Azure #0078d4)
Subtitle	'Copilot (Edge) · External validation · Always last gate' (Montserrat, 8px, muted)
Overall badge	AWAITING (grey) → ALL CLEAR (green) → ISSUES FOUND (red) → PARTIAL (amber)
Timestamp	Last validated: [timestamp] or 'Not yet validated'
[RUN VALIDATION] button	Azure bg, white text. Fires Copilot validation. Disabled while running.

4 Validation Check Rows

Check	Icon	Pass State	Fail State	Warning State	What It Examines
Syntax Check	< />	Green dot 'Clean'	Red dot '[N] errors'	Amber dot '[N] warnings'	Missing brackets, typos, malformed JSX, broken imports
Logic Review	~	Green dot 'Sound'	Red dot 'Logic gap'	Amber dot 'Review'	Conditional logic, state management, data flow correctness
Security Audit	■	Green dot 'Safe'	Red dot '[N] issues'	Amber dot 'Review'	Exposed keys, unsafe data handling, permission gaps, XSS risks
Azure Readiness	■	Green dot 'Ready'	Red dot 'Not ready'	Amber dot 'Partial'	Azure connector compatibility, service stub results, cloud patterns

Flag Detail — When a Check Fails

Element	Detail
Trigger	Any check returns fail or warning — detail section expands automatically
Issue line	Short description of what failed. e.g. 'Undefined variable on line 42'
Location	File + line number where possible. e.g. 'CommandAIHub.jsx : 42'
Suggested fix	One-line plain English fix. e.g. 'Import AIConnector from entities before use'
Severity tag	CRITICAL (red) · WARNING (amber) · INFO (blue)
[FIX IN CHAT] button	Opens a pre-filled message to ENGINEER: 'Fix this issue: [issue detail]'. One click to route to the right person.

Validation History Log

Last 3 VALIDATOR runs shown at the bottom of the panel — collapsible. Each entry: timestamp + overall result + which checks passed/failed. Click any entry to expand the full breakdown. Gives full audit trail without cluttering the panel.

UPDATED RIGHT PANEL — Full Layout v1.2.1

Section	Height	Content
Code Preview	~35%	Dark bg #1a1a1f · monospace white · latest CODE READY · 'Generated by [DUTY NAME]' above
Simpee Status	~8%	SIMPEE badge: [NOT CHECKED] amber → [VALIDATED] green → [ISSUES] red [MARK AS TESTED] button
GATEKEEPER PANEL	~40%	Header: VALIDATOR title + overall badge + [RUN VALIDATION] button 4 check rows: Syntax · Logic · Security · Azure Flag detail (auto-expands on fail) Validation history log (collapsible, last 3 runs)
Deploy Button	~7%	Disabled until: Simpee = green AND all 4 Gatekeeper checks = green Confirmation: 'Simpee + Validator approved. Deploy to 5S Portal?' On deploy: writes to 5S Portal NoticeBoard
Deploy Log	~10%	Last 3 deploys: timestamp + what + model + validator result

TESTLOG UPDATE — Granular Validation Records

Each VALIDATOR run now writes 4 individual TestLog records — one per check. This means every checkpoint is logged separately with full detail. Makes it easy to see exactly what passed and what failed across all deploys.

Field	Record 1 — Syntax	Record 2 — Logic	Record 3 — Security	Record 4 — Azure
test_name	Syntax Check	Logic Review	Security Audit	Azure Readiness
status	pass / fail	pass / fail	pass / fail	pass / fail
result	'Clean — no errors' or issue detail	'Sound' or logic gap detail	'Safe' or vulnerability detail	'Ready' or incompatibility detail
tested_at	ISO timestamp	ISO timestamp	ISO timestamp	ISO timestamp
fixed	false (until Engineer fixes)	false	false	false
validator	Copilot	Copilot	Copilot	Copilot

THE AI FAMILY — All 8 Members + Future Joiners

Duty Name	Model	Voice / How They Speak	Handoff To	Status
ORCHESTRATOR	Automatic	Calm, neutral, decisive. Routes without opinion.	—	Active
RESEARCHER	Gemini 3.1 Pro	Precise, data-driven, thorough. Cites sources. Never guesses.	ANALYST	Active
ANALYST	Sonnet 4.6	Clear, structured, efficient. No fluff. Gets to the point.	STRATEGIST	Active
STRATEGIST	Opus 4.6	Methodical, logical, direct. Evaluates options. Flags threats.	THINK TANK	Active
THINK TANK	Opus 4.8	Exploratory, nuanced, questioning. Challenges assumptions.	ARCHITECT	Active

ENGINEER	GPT-5.4	Technical, precise, no-nonsense. Gives working code.	STRATEGIST	Active
ARCHITECT	GPT-5.5	Creative yet structured. Thinks in systems.	ENGINEER	Active
VALIDATOR	Copilot (Edge)	Authoritative, thorough, uncompromising. Green or Red — nothing in between.	DEPLOY	Active
DESIGNER	Canva AI	Visual, aesthetic, brand-conscious. Thinks in layouts and color.	ARCHITECT	Planned
BRAND DIRECTOR	Looka AI	Identity-focused. Consistent, purposeful, brand-led.	ANALYST	Planned

BUILDER PREFIX — Complete Implementation Brief

"Update CommandAIHub.jsx, aiCommandCentre function, and TestLog entity for the complete v1.2.1 build: 1. ROLE-AWARE CHAT: Add intro_message, voice_style, handoff_to fields to AIConnector entity (already seeded). When a message addresses a duty name (RESEARCHER, ENGINEER etc.), load that AI's role context and respond in-character — intro line on first use per session, sign-off at end, handoff line to next AI. Add @mention parsing. Add [PASS TO NEXT] button on each response card. 2. GATEKEEPER PANEL: Replace the dual-badge row in the right panel with a full Gatekeeper Panel. Show 4 check rows: Syntax Check, Logic Review, Security Audit, Azure Readiness — each with pass/fail/warning dot and detail. Auto-expand flag detail on failure with issue description, location, severity tag, and [FIX IN CHAT] button routing to ENGINEER. Add validation history log (last 3 runs, collapsible). Deploy button only active when Simpee = green AND all 4 checks = green. 3. TESTLOG: Each VALIDATOR run writes 4 separate TestLog records — one per check — with test_name, status, result, tested_at, fixed=false, validator=Copilot. Same design system: #e8e6fe bg, #5e50fb accent, #0078d4 for Gatekeeper Panel, Exo 2 headlines, Montserrat body. No emoji."

GOLDEN RULES — The AI Family Company

#	Rule	Detail
1	No solo deployments	No AI approves its own output. Every stage has a gatekeeper.
2	VALIDATOR is always last	All code passes Copilot before touching 5S Portal. Always.
3	Blueprint before code	Any change needs a blueprint update first. No exceptions.
4	Diagnose before build	Full diagnostic before any implementation begins.
5	Gate must pass	Gatekeeper flags = back to primary. No overriding.
6	Roles are fixed	Each AI stays in their lane. VALIDATOR does not generate code.
7	Duty names only in UI	No model names shown. Model name in tooltip only.
8	All 11 checkpoints	Every feature must pass all 11 before going live.
9	Every deploy generates a debrief	ANALYST writes post-deploy notes. System gets smarter every time.
10	New members get proper onboarding	Onboarding protocol. No AI just shows up — they join with purpose.
11	Gatekeeper Panel, not just a dot	VALIDATOR shows what was checked and why. Full transparency before every deploy.
12	The goal over the target	We check alignment. We catch blind spots. We build together.
