

COMMAND AI HUB

SIMPLEX-ITY · AI ROLES, RESPONSIBILITIES & GATEKEEPER SYSTEM

Version 1.2.1 FINAL · 31

May 2026

Co-authored: Kieran Li + Simpee + Edge (Copilot)

New: AI Roles + Dual Gatekeeper System

PHILOSOPHY: Every AI in the Command AI Hub has a defined role and primary duty. No AI works alone on anything critical — every decision, code block, or deployment requires at least two AIs to review and agree before it proceeds. This is the Gatekeeper System.

AI TEAM — Roles, Duties & Position Names

Each AI has been assigned a duty name based on its natural strengths. These names appear in the Hub UI.

AI Model	Duty Name	Provider	Strengths	Primary Role in Hub	Colour
Automatic	DIRECTOR	Base44	Routes to best model per request. Sees the big picture.	Orchestrator — picks which AI handles each task.	#555555
Gemini 3.1 Pro	RESEARCHER	Google	Long context, web grounding, deep information gathering.	Research phase, brogthers edge, finds #128516	#128516
Claude Sonnet 4.6	WRITER	Anthropic	Clear, structured writing. Fast. Excellent at drafting, summaries, documenta	Drafting, summaries, drafting, summaries, documenta	#997700
Claude Opus 4.6	STRATEGIST	Anthropic	Deep reasoning, multi-step logic, planning.	Planning phase, breaking down complex problems.	#007700
Claude Opus 4.8	ARCHITECT	Anthropic	Most capable Anthropic model. System design, design-logics, system architecture.	System design-logics, system architecture, app architecture.	#555500
GPT-5.4	BUILDER	OpenAI	Code generation, structured output, API building.	Build phase, writes the actual JSX, backend functions, entity logic.	#007777
GPT-5.5	INNOVATOR	OpenAI	Most capable OpenAI model. Creative problem-solving, novel approaches.	Brainstorming, developing new ideas, UX improvements.	#007733
Copilot (Edge)	GUARDIAN	Microsoft	External validation, security review, Azure readiness.	Final gates, syntax, security, Azure readiness.	#007700

THE GATEKEEPER SYSTEM — Joint AI Review at Every Stage

No single AI can approve its own work. Every stage has at least 2 AIs reviewing before the output moves forward. The GUARDIAN (Copilot) is the final gate — always. Nothing deploys without it.

Stage	Task	Primary AI	Gatekeeper AI	What Gatekeeper Checks	Pass Condition
1 — Research	Gather context, references, research data.	RESEARCHER (Gemini 3.1)	STRATEGIST (Opus 4.6)	Is the research complete? Are sources relevant and accurate?	Strategist confirms research is sufficient to move forward.
2 — Strategy	Break down problem, plan solution, evaluate options.	STRATEGIST (Opus 4.6)	ARCHITECT (Opus 4.8)	Is the plan logical? Are edge cases covered?	Architect approves the plan before build begins.
3 — Design	Design entities, data flows, system architecture.	ARCHITECT (Opus 4.8)	BUILDER (GPT-5.4)	Can this be built? Are entity schemas correct and implementable?	Builder confirms design is implementable.
4 — Build	Write JSX, functions, entity logic, API wiring.	BUILDER (GPT-5.4)	STRATEGIST (Opus 4.6)	Does the code match the plan? Are there logical errors or missing edge cases?	Strategist confirms code is approved for deployment.
5 — Communication	Draft emails, briefs, docs, write content.	WRITER (Sonnet 4.6)	DIRECTOR (Automatic)	Is the tone correct? Is it appropriate to send this message?	Director approves content for any external communication.
6 — Innovation	New feature ideas, UX improvements, creative problem-solving.	INNOVATOR (GPT-5.5)	STRATEGIST (Opus 4.6)	Is the idea feasible? Does it align with 5S Postcard? Prioritize.	Strategist confirms feasibility before adding to backlog.
7 — Final Deploy	Any code going to live.	BUILDER (GPT-5.4)	GUARDIAN (Copilot)	Syntax, logic, security, Azure readiness.	Guardian must return green. No exceptions.

WORKFLOW — From Idea to Deployed Feature

At each gate: primary AI produces output → gatekeeper AI reviews → both must agree → move to next stage. If gatekeeper flags an issue → back to primary AI to fix → re-review. No skipping.

UI LABELS — How Names Appear in the Hub

The chip row, status panel, and response cards all use DUTY NAMES, not model names. Model name shown in tooltip only.

Chip Label	Status Panel Label	Response Card Header	Tooltip (hover)	Provider Colour
AUTO	DIRECTOR — Auto	DIRECTOR responded	Automatic — routes to best model	#5e50fb
RESEARCHER	RESEARCHER — Gemini	RESEARCHER — Gemini 3.1 Pro	Gemini 3.1 Pro (Google)	#4285f4
WRITER	WRITER — Sonnet	WRITER — Sonnet 4.6	Claude Sonnet 4.6 (Anthropic)	#d97706
STRATEGIST	STRATEGIST — Opus	STRATEGIST — Opus 4.6	Claude Opus 4.6 (Anthropic)	#d97706
ARCHITECT	ARCHITECT — Opus	ARCHITECT — Opus 4.8	Claude Opus 4.8 (Anthropic) NEW	#f59e0b
BUILDER	BUILDER — GPT	BUILDER — GPT-5.4	GPT-5.4 (OpenAI)	#10a37f
INNOVATOR	INNOVATOR — GPT	INNOVATOR — GPT-5.5	GPT-5.5 (OpenAI) NEW	#10a37f
GUARDIAN	GUARDIAN — Copilot	GUARDIAN — Copilot	External validation only — not code gen	#0078d4

BUILDER UPDATE — How to Implement Roles in the Hub

1	Rename chips in AI Selector Row Replace model names with duty names: AUTO · RESEARCHER · WRITER · STRATEGIST · ARCHITECT · BUILDER · INNOVATOR · GUARDIAN Tooltip on hover shows full model name + provider.
2	Rename status panel cards Each card header: DUTY NAME — Model E.g. 'GUARDIAN — Copilot' not 'Copilot (Edge)'
3	Rename response card headers Card 1 header: 'RESEARCHER — Analysis' not 'Gemini 3.1 Pro — Analysis'
4	Add gatekeeper indicator to cards After primary AI card, show a 'PENDING GATE' badge. When gatekeeper reviews: badge changes to 'GATE PASSED' (green) or 'GATE FLAGGED' (red).
5	Update AIConnector seed data Update model_name field to include duty name: { model_id:'1', model_name:'RESEARCHER — Gemini 3.1 Pro', ... }
6	Paste to builder — exact prefix 'Update CommandAIHub.jsx. Replace all AI model labels with duty names: AUTO=DIRECTOR, Gemini=RESEARCHER, Sonnet=WRITER, Opus4.6=STRATEGIST, Opus4.8=ARCHITECT, GPT-5.4=BUILDER, GPT-5.5=INNOVATOR, Copilot=GUARDIAN. Add gatekeeper badge to each response card. Tooltip shows full model name. Same design system.'

GOLDEN RULES — Non-Negotiable

#	Rule	Detail
1	No solo deployments	No single AI approves and deploys its own output. Ever.

2	Guardian is always last	GUARDIAN (Copilot) reviews ALL code before any deploy. Cannot be bypassed.
3	Blueprint first	Any change to the Hub or 5S Portal requires a blueprint update before a single line of code is written.
4	Diagnose before build	Before implementing anything, Simpee runs a full diagnostic on current state.
5	Gate must pass	If a gatekeeper flags an issue, work goes back to primary AI. No overriding the gate.
6	Roles are fixed	Each AI stays in its lane. GUARDIAN does not generate code. BUILDER does not do final validation.
7	All 11 checkpoints	Every feature deployment must pass all 11 checkpoints before going live in 5S Portal.
